Widget

Flutter apps are made up of different widgets. These widgets are highly customizable and allows for functions to process data and handle various events. For instance, in this app when double tapping/clicking on an element will delete the task.

Padding widget:

This widget adds empty space around one or more widgets or elements.

Scaffold widget:

The Scaffold widget occupies the whole screen and provides a framework to implement basic material design layout in the application.

AlertDialog widget:

This widget prompts the user with a confirmation box. In this box the user can input a text for a task and save it to the list of todos.

MaterialButton widget:

This creates a button which can be used to confirm a selection, accept, or decline a selection or send data.
